

Welcome to Jade Source

Jade Source is a bulletin from Jade Software Corporation, designed to help you be more successful with JADE. Jade Source is used to communicate a variety of technical information, including:

1. Technical and operational updates for JADE and JADECare customers, including general information that would previously have been advised only to an originator of a PARSYS contact.
2. Tips for developers and operations staff.
3. Advice about important hot fixes.

If you have any comments about Jade Source or suggestions for future bulletins, please let us know at: jadesupport@jadeworld.com.

Hot Fix 6.2.15.021

After upgrading to JADE 6.2.15 from 6.1 or any 6.2 releases, users may encounter a 1310 unhandled exception when loading schemas if those schemas have exposures for Web services, C-API, or Java.

To avoid this, users should apply hot fix 6.2.15.021 as part of the 6.2.15 upgrade, or immediately after upgrading and before loading the first user schema.

A workaround in lieu of having the hot fix is to run the JADE Logical Certifier for meta data after upgrading. It will produce a .FIX file that includes fixes for the **JadeExposedClass** class. Running the repair process with this .FIX file will also correct the issue.
